**Re: Phase 2 - FY 2022 Draft Annual Operations Plan  
North Cascade District/Santiam State Forest  
Fern Ridge Operation**

Dear Board Members and State Forester:

Thank you for accepting these comments on the draft Fiscal Year 2022 Annual Operations Plan (AOP), Phase 2, for the North Cascade District, comprising the Santiam State Forest. These comments reiterate concerns expressed in our letter regarding the larger the FY22 AOP, where applicable specifically to the Fern Ridge plan.

As the Board and staff are aware, approximately one-third of the Santiam State Forest was impacted to greater or lesser degrees by wildfires in 2020 resulting in mosaic burn patterns across the forest. Of this, the Department deemed approximately 3,500 acres available for post-fire logging, and the Department proposed in its 2021 IP Revision and accompanying 2021 AOP to log all 3,500 acres, subject to revision.

Some portion of this logging has occurred under a series of salvage sales contracted pursuant to the 2021 AOP. The current draft 2022 AOP and now Phase 2 proposes to log much of the remainder.

Our organizations have invested heavily in the Santiam fire recovery process since late 2020, and while we are encouraged to see that some operational changes have made their way into this draft AOP, overarching concerns remain. As such, many of the points we have submitted to the Board and the Department in prior comment letters and testimony throughout the post-fire planning process represent ongoing problems, and we incorporate by reference those previous communications here.

As an initial matter, we have repeatedly raised the following point regarding ODF's short-term planning on the Forest while also moving forward in a long-term planning process: a wide range of stakeholders has participated extensively in the development and vetting of the Western Oregon State Forests Habitat Conservation Plan (HCP) and the new Forest Management Plan

(FMP). Broad conservation commitments, along with specific mapped conservation units, while not finalized, are the working assumptions for the approval of those plans.

In good faith, stakeholders are working toward management for the Santiam that relies for its conservation values, in large part, on the habitat value of these two land-use allocations. As we have noted before, if the habitat values of these areas are degraded by ODF operations prior to implementation of the HCP/FMP, then these assumptions may need to be revised. In that case, ODF may not be able to rely on those HCAs/RCAs to contribute toward the conservation requirements of the plan.

The Fern Ridge project would clearcut log 14 acres of post-fire stands with a Desired Future Condition designation of Layered, or Complex. Additional post-fire areas would be underplanted or would remain unmanaged. Some 200 acres would be logged for hazard-tree mitigation. Our understanding is that the Fern Ridge project is within stands mapped for conservation areas in the draft Western Oregon Habitat Conservation Plan (HCP).

- As we've discussed with ODF staff and the Board, it is poor form to do heavy salvage logging like the modified clearcut (and likely some of the hazard tree removal) in areas that are slated for long-term protection under the draft HCP as a habitat conservation area and riparian conservation area.
- The area is designated under the current Forest Management Plan for a desired future condition of "Layered," which is a complex forest stand. The current Forest Management Plan requires ODF to manage toward mature forest characteristics there. Clearcut logging will set back the stand's development into complex, layered forest by decades. The best way to manage for mature forests after a fire is not to log them.
- ODF also has no need to run a demonstration project on whether logging after a fire slows development into mature forest, as the Fern Ridge plan seems to indicate. The scientific consensus regarding the negative impacts of post-fire logging on ecosystem recovery is solid. *See attached research synthesis.*
- The roadside hazard-tree removal plan is too extreme – it proposes 1.5 tree heights being cleared on both sides of a road. One tree height is more than enough to ensure access and safety. Downslope sides of a road should require an even narrower width of tree removal, due to the unlikelihood of those trees falling across the road. Anything more than that looks like a timber grab versus true hazard tree removal.

We request the Department hold off on any further auction and sale of these timber sales until it withdraws any logging units in proposed HCAs or RCAs.

Sincerely,

## **Statement of Dominick A. DellaSala, Ph. D, Chief Scientist, Wild Heritage**

### **Statement of Intent**

The facts set forth in this declaration are based on my scientific expertise, review of the relevant scientific literature, review of the Oregon Department of Forestry (ODF) North Cascade District 2021 Annual Revised Operations Plan (AROP), review of “Stand Type 5-Older Forest Structure (OFS) Stand Development Process – Understory Reinitiation” and “Stand Type 4-Layered (LYR) Stand Development Process-Understory Reinitiation (UR),” and relevant timber sales related to complex and non-complex forests. My evaluation of these materials reflects my professional judgment based on the facts reviewed in relation to whether the best available science was applied by ODF in the context of “post-fire modified clearcuts.” To the extent that ODF claims these clearcuts are necessary to attain “complex” features and “Desired Future Conditions” (DFC) for older forest structure, I show that there is compelling evidence to the contrary and that ODF’s claims are not supportable.

### **Qualifications**

I am forest scientist with more than 3 decades experience in wildlife biology, ecology, climate change, and endangered species management. I hold a B.S. degree in Biology from Adelphi University (1979), M.Sc. from Wayne State University (1982), and Ph. D in Natural Resources from the University of Michigan (1986). As a post-doctoral research fellow in the 1980s, I conducted studies of the Northern Spotted Owl at the HJ Andrews Experimental Station in Blue River, Oregon, and bald eagles in Oregon’s Willamette Valley and the Klamath Basin. I have published over 200 articles and books on forest ecosystems, imperiled species, and fire ecology. Several of my publications are of complex early seral forests (CESF) maintained by periodic wildfires of mixed intensities from the Sierra Nevada and Klamath-Siskiyou regions to the dry forested Cascades in Washington and Oregon. I have also worked in riparian areas and forests spanning the successional gradient from CESF created by natural disturbances to temperate rainforests hundreds of years old. I have served as Adjunct Faculty at Southern Oregon University and Oregon State University. My CV is attached as Exhibit A.

### **Assessment of ODF logging practices and DFC**

ODF defines DFC for various land categories under their jurisdiction based on stand-level criteria that are supposed to be used to set aside and/or manage areas so they can develop into older forest condition. Mostly at issue are stands ODF designated for the DFC of "complex" forest and other stands (non-complex) scheduled for “post-fire modified clearcut.” According to ODF, “complex” includes two sub-types: layered, and older forest structure.

I focused mainly on timber sales illustrative of "complex" forest that the ODF is claiming need post-fire modified clearcutting to attain DFC:

- Gawley Panther - 664 acres “post-fire modified clearcut,” DFC Layered stands (37 acres) and Older Forest Structure stands (40 acres).

- Niagara Restoration – sold, logging ongoing/completed - 362 acres “post-fire modified clearcut,” DFC Layered (80 acres) and Older Forest Structure (12 acres). No green trees in complex acres.
- Packsaddle - 304 acres “post-fire modified clearcut,” road construction and rock pit expansion (7 acres). DFC is Layered (51 acres) and non-complex (287 acres). No green trees in LYR. Unknown area of this sale (perhaps all?) was Layered or Older Forest Structure prior to fire.
- Sevenmile – Sold, stands marked - 158 acres “post-fire modified clearcut,” DFC Layered (9 acres), non-complex (149 acres). 12 acres were Older Forest Structure prior to fire.
- Monument Peak - Sold - 82 acres “post-fire modified clearcut,” No DFC complex but some stands were LYR prior to fire.
- Stout Creek Restoration - Sold - 275 acres “post-fire modified clearcut”, no DFC complex but was in some unknown complex (OFS or LYR) condition prior to fire.

In my evaluation of ODFs claim that these stands require “modified clearcuts” to attain DFC, I used best available science as follows.

### **Post-Fire Modified Clearcuts Will Not Achieve DFC for Complex Forests**

I have published extensively on the conditions necessary to maintain CESF created by natural disturbances and how these biologically diverse forests are connected across the successional gradient from newly established to older forest conditions (e.g., reviewed in Swanson et al 2011, DellaSala et al. 2014, DellaSala and Hanson 2015, DellaSala et al. 2017, DellaSala 2020). There is absolutely no evidence in the published ecological literature or my experience that so-called modified clearcuts are needed to create complex features nor will they result in the desired future condition of layered older forest stands. This inherently flawed assumption by ODF is unsupported for at least two reasons: (1) as noted below, modified clearcuts harm attainment of complex structures by removing the vast majority of biological legacies created in natural disturbances; and (2) minimum retentions of biological legacies in modified clearcuts are not sustainable nor adequate to develop complex features (i.e., the bare minimum of 7-11 trees retained per acre will be subject to wind throw and other collateral disturbances given their high exposure to the elements in surrounding clearcuts).

Complex forests are connected across the seral gradient from newly established to late successional forest. Their complexity is determined by the initiating natural disturbance that generates a “pulse” of biological legacies – for instance, a severely burned patch of older trees contains an abundance of biological legacies that will sustain that forest through succession for decades (Figure 1). Notice how complexity in Figure 1 is highest right after the initiating disturbance, how that naturally declines in mid-seral stages, and then re-emerges as forests mature via natural mortality processes replenishing biological legacies. Complexity is a function of live and dead trees, live shrubs, soil processes, seeds of plants in soils even in the most severe disturbance (Donato et al. 2012).

Figure 1. Stand level complexity across a seral gradient (Donato et al. 2012). Note: Forest succession is not linear, rather it is cyclical and even within a mature forest, gap phase dynamics replenish legacies but the initiating disturbance creates the vast majority of them through a pulse event whereby patches of mature trees are killed by the natural disturbance that are linked to the structural features carried through seral stages. Photos K. Crocker

ODF claims some of the aforementioned timber sale areas have nothing living in them. In my decades of working as a forest ecologist, I have never witnessed any severely burned stand with nothing living in it. In fact, DellaSala and Hanson (2019) documented extensive conifer establishment shortly after severe fire patches thousands of acres in size in pine and mixed conifer forests throughout the West. Even in the largest severely burned patches, conifer seed sources (live trees) were present within the burn patch interior and conifer seedlings present in 1-5 years postfire. ODFs claims run counter to best available published datasets on post-disturbance processes, including the role of biological legacies in all severely burned forests (mycorrhizae, seed sources in the soil, surviving shrubs and forbs, live and dead trees – the severely burned forest is alive if you know what and where to look). Contrary to ODFs assumption, CESF actually contain a rich diversity of small mammals and birds that depend on the complex structures provided by the pulse of biological legacies (DellaSala and Hanson

2015). It is simply false to claim some severely burned forests have nothing living and I would gladly conduct a field tour with ODF to show how alive these forests really are – in fact, they have comparable levels of biodiversity as old-growth forests (Swanson et al. 2011, DellaSala et al. 2014, DellaSala and Hanson 2015, DellaSala et al. 2017).

Further, ODF claims that: “Retained legacy structure quality and configuration will vary from unit-to-unit based on the site characteristics. Within post-fire regeneration harvest units, live green trees and any remnant old growth trees within the timber sale perimeters will be retained where operationally possible and safe to do so. Green trees are defined as having 10-30% of live crown in respect to total tree height depending on site conditions, stand conditions, burn severity, and future management goals.” 10-30% of live crown in respect to total tree height is not a legitimate way to assess whether a tree will survive a burn. In fact, my own postfire monitoring work in Sierra mixed conifer forests show flushing rates in large pines that appeared dead in the fall of the fire but during the following spring were flushing new needles. The US Forest Service incorrectly classified them as “dead” and salvageable even though they were alive and flushing new needles (DellaSala et al. 2015). Thus, operating under these guidelines ODF is going to log live, green trees that may in fact flush new needles and even if they die are still critically important legacy trees that shelter developing undergrowth and evolve into large legacy trees characteristic of older, complex forests. The 10-30% standard appears arbitrary given conifers with even less live canopy foliage are known to flush new needles (DellaSala et al. 2015).

Regarding complex features, the chart below (Table 1) generally illustrates the difference in legacies generated and retained by natural disturbances (left column and image) vs. what resembles the conditions in a postfire modified clearcut (right column and image). Legacies in this comparison refer to both living and dead structural features and coarse woody debris (CWD) including large logs, while heterogeneity refers to within and among stand structural and compositional features where biodiversity is highest. ODF’s modified clearcuts resemble the right column and in no way illustrate the complexity of naturally disturbed areas in the left column. And to reiterate, because seral stages are connected across the successional gradient by legacies, how you manage the forest in stand initiation impacts the entire seral gradient especially desired future conditions. Thus, in no way is conducting a modified clearcut in a post-fire forest necessary or conducive to developing structurally complex, old forest conditions down the line. This assumption by ODF, to the extent it is even being made, is completely false and is not based on best available science. In sum, ODF is failing to see the forest for the legacies.

Table 1. General illustration of differences between complex early seral forests created by natural disturbances and postfire modified clearcuts like that of the ODF timber sales. Comparisons are summarized from field plots and observations of the Biscuit fire burn area. Plus/minus signs reflect relative abundance categories ranging from minus (none remaining) to +++ maximum present.

Complex Forest Attribute	 K Schafer	
Legacies	+++/+	-/+
Snags	+++/+	-/+
CWD	+++/+	-/+
Understory	++/-	-
Heterogeneity	+++/+	-
Time in early seral	+++/+	-
<small>Source: adapted from Swanson et al. (2010); DellaSala et al. 2013</small>		

To illustrate this difference further, ODF cannot claim that modified clearcuts accelerate complex structures for desired future conditions as there is compelling evidence of the contrary in the time sequence in Figure 2 from field plots and photo observations of the Biscuit burn area (findings are supported by the published literature of the Biscuit postfire logging – Donato et al. 2006). The top panels (left to right) illustrate removal of most of the biological legacies immediately after the Biscuit fire in 2002 and a decade later on the same site with little if any postfire regeneration or legacies remaining. Most of the few retained legacies blew down as they were left exposed on a ridge. The bottom panels are from a site just upslope of the logged area in a protected botanical area ten-years post-disturbance (similar slope, aspect, elevation). Notably, Donato et al. (2006) found natural conifer seed establishment even in the largest burn patches exceeded stocking densities of the Forest Service and postfire logging killed most of the naturally re-establishing seedlings. Based on these and my own studies, I anticipate the ODF guidelines will cause irreparable harm to natural processes re-establishing severely burned forests.

# BISCUIT AFTER FIRE

Figure 2. A comparison of logged (top panels) vs. unlogged (bottom panels) in the Biscuit burn area of the Rogue-Siskiyou National Forest across a time sequence. Notice the lack of structural retentions 10 years after the burn and the lack of conifer establishment in the logged areas (top panels) where some trees were retained compared to unlogged botanical areas that show a proliferation of growth and legacies. Large dead trees in the botanical area anchor soils, provide shade for developing conifers and other vegetation, and even though severely burned, the stand was full of life.

Figure 3 below illustrates the connection between complex early and late seral forests in a natural disturbance sequence that links seral stages through time via the pulse of biological legacies created in a severe disturbance in a mature forest with structure (top sequence). In the unlogged natural system, a beneficial relationship of biological legacies and ecosystem processes is maintained across seral stages. In the logged sequence, a damaging feedback loop is created whereby most – if not all – of the biological legacies are removed setting in motion a novel disturbance cycle where fire or logging repeatedly removes trees before they can acquire legacy structures. That is – ODF’s claim that logging is needed to retain complex structures or created desired future older conditions is completely unsupported.

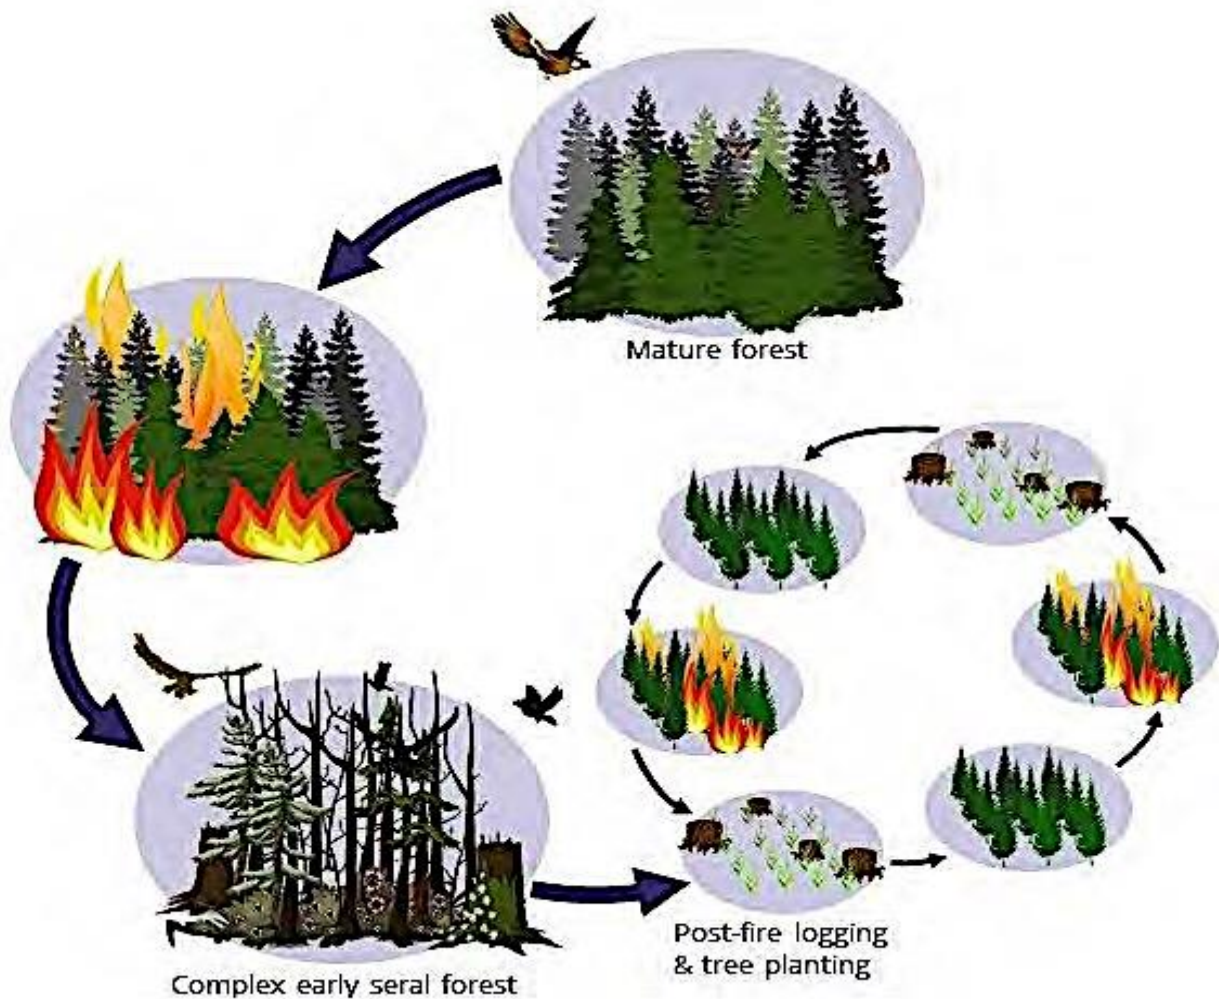

Figure 3. Complex early seral forests are created by a naturally severe disturbance like a severe wildfire that creates a “pulse” of biological legacies needed to sustain the ecosystem for decades. That natural process is disrupted by modified postfire clearcuts setting in motion a novel feedback of logging followed by severe disturbances and more logging and so on, such that complex or desired future old forest conditions are never attained (summarized from publications by DellaSala and Hanson 2015, DellaSala et al. 2017, DellaSala 2020).

**Cumulative Effects of Post-fire Logging Will Prevent Not Accelerate Desired Future Conditions**

Response of fire-adapted species and communities to post-fire logging depends on the scale, intensity, degree of biological legacies removed (McIvar and Starr 2000, Lindenmayer et al. 2006, 2008), disturbance history of the site (Reeves et al. 2006, Hutto 2008), and species-specific tolerances to logging. In general, documented impacts include alteration of stand structure and function, loss of soil nutrients, chronic sedimentation and erosion, reduction in carbon storage and increase in carbon emissions, increased fine fuel loads and re-burn severity, degradation of endangered species habitat, reduced habitat and prey for apex predators, reduced snag densities

for cavity nesting birds and mammals, exotic species invasions, and lowered resistance and resilience of post-fire landscapes to future disturbances, among other alterations (Karr et al. 2004, Lindenmayer et al. 2004, Hutto 2006, Hanson and North 2008, Lindenmayer et al. 2008, DellaSala et al. 2014; Table 2). Such impacts may accumulate in time and space and if practiced over large landscapes can lead to type conversions and landscape traps. That is – as in Figure 3 above – the landscape becomes increasingly permeable to severe disturbances and the loss of natural functions as complex forests are oversimplified by logging (Lindenmayer et al. 2011).

Nearly unanimous results like those presented in Table 2 and illustrated throughout show a widespread and consistent pattern of post-fire logging impacts across taxa and regions; arguably this type of logging is more severe in its adverse impacts than logging in green forests. The combination of post-fire logging and removal of native shrubs through herbicides—as is commonly practiced in the western USA—dramatically increases the spread of invasive (and often highly combustible) weeds (McGinnis et al. 2010). The fire to post-fire logging to intense fire feedback noted above is likely to accelerate in a changing climate where more fires are expected to trigger more logging, which already is occurring in the western USA.

Table 2. Literature summary of impacts of post-fire logging and related actions (reprinted from DellaSala et al. 2015).

Location	Attribute	Ecosystem Impacts	Source
Broadly applicable	Process, structure, function	Altered and diminished stand structural complexity, ecosystem processes and functions, and populations of species and community composition	Karr et al. 2004, Lindenmayer and Noss 2006, Burnett et al. 2012, DellaSala et al. 2014
Mostly western USA but broadly applicable	Chronic soil erosion	Erosion is greatest when logging is associated with road building, conducted with ground-based log retrieval systems, or undertaken in areas with steep slopes and sensitive soils; erosion occurs when logs are dragged across	McIver and Starr 2000, Beschta et al. 2004, Karr et al. 2004

		steep slopes, and damage to soil horizons occurs from burning of slash piles	
Mostly western USA but broadly applicable	Aquatic and hydrological processes	Substantial disturbance of hydrological systems especially from chronic sediments from roads  Removal of burned trees that provide shade may hamper tree regeneration especially on high-elevation or dry sites; increased frequency and magnitude of erosive high flows and raising of sediment loads (these changes alter the character of river channels, harming aquatic species); construction and reconstruction of roads and landings accelerate runoff and chronic erosion harmful to aquatic systems	Karr et al. 2004
Western USA	Riparian areas	Inhibit riparian functions	Reeves et al. 2006
Western USA	Logging slash and fuels	Increased combustible fuels left on site	Weatherspoon and Skinner 1995, Duncan 2002, Donato et al. 2006

Western USA	Herbicides	Used to kill shrubs viewed as competitors of commercially valuable trees, though such shrubs are important to nutrient cycling and mycorrhizae development often lacking in industrial settings (e.g., private lands), and data do not indicate that shrub cover precludes conifer regeneration; herbicide spraying strongly tends to increase invasive weeds	Beschta et al. 2004, Shatford et al. 2007, McGinnis et al. 2010
Pacific Northwest and northern California, USA	Threatened, Endangered, and Sensitive Species	Local extirpation of Northern Spotted Owl ( <i>Strix occidentalis caurina</i> ) territories (Clark et al. 2013), and California Spotted Owl territories ( <i>Strix occidentalis occidentalis</i> )	Lee et al. 2012, Clark et al. 2013
West-central Alberta, Canada	Acorn predators	Alters the guild of acorn predators and may reshape the pattern of seedling establishment	Puerta-Pinero et al. 2010
Victoria, Australia		After a 1939 wildfire in Victoria, logging	Lindenmayer et al. 2004

		contributed to shortage of cavity trees for more than 40 vertebrate species, including some endangered ones.	
Mostly western USA; Quebec, Canada	Plant richness and biomass, understory vegetation	Reduced vegetation biomass, increase graminoid (grass) cover, overall reduced plant species richness and survival of planted seedlings relative to unlogged areas; reduced understory abundance, richness and diversity	McIver and Starr 2000, Donato et al. 2006, Titus and Householder 2007, Purdon et al. 2009
Western USA, Victoria-Australia	Biological legacies	Removal of a great percentage of large dead woody structure significantly alters post-fire wildlife habitat (partial removal less so)	Lindemayer et al. 2004, Beschta et al. 2004, Russell et al. 2006
New England, USA	Resistance/resilience to disturbance	Post-disturbance logging and silvicultural attempts after hurricane and insect outbreak failed to improve resistance or resilience of forests and were degrading overall	Foster and Orwig 2006

Mostly western USA	Exotic species	Increases in invasions related to soil disturbance, livestock, road pathways, greater human (vector of spread) site access, and herbicide spraying	McIvar and Starr 2000, Beschta et al. 2004, Karr et al. 2004, McGinnis et al. 2010
Mostly western USA but broadly applicable	Ecosystem restoration	Post-fire logging inconsistent with comprehensive restoration goals	Beschta et al. 2004, Donato et al. 2006, Swanson et al. 2011, DellaSala et al. 2014, Hanson 2014
Southwest Oregon, USA	Conifer seedlings	<p>Natural conifer regeneration two years after the 2002 Biscuit fire, although variable, was abundant even in high-severity burn areas where conifer seedling densities (&gt;120 per ha) exceeded regional standards for fully stocked stands.</p> <p>Post-fire logging reduced median conifer regeneration density by 71%, impacted conifer seedlings by damaging soils and by physical burial of seedlings by woody material due to logging; significantly increased fine- and coarse-woody fuel loads</p>	Donato et al. 2006

Victoria, Australia	Cavity nesting mammals and birds	Removal of hollows altered persistence of an array of cavity-using species including the endangered arboreal marsupial, Leadbeater's possum ( <i>Gymnobelidues leadbeateri</i> ).	Lindenmayer and Ough 2006
Western, USA		Reduced multi-aged montane ash forests that typically support the highest diversity of arboreal marsupials and forest birds.	Lindenmayer and Ough 2006
		Reduction in abundance and nesting density of cavity-nesting birds	Caton 1996, Hitchcox 1996, Hejl et al. 1995, Saab and Dudley 1998, Smucker et al. 2005, Hutto 2006, Hutto and Gallo 2006, Cahall and Hayes 2008 (some open-nesting birds increased), Hanson and North 2008, Hutto 2008, Burnett et al. 2012
Canadian Rockies, Alberta, Canada; eastern Oregon	Apex predators and forest carnivores	Avoidance of logged areas in wolf-ungulate system; post-fire logging, thinning, and conversion	Bull et al. 2001, Hebblewhite et al 2008

		from fir to pine adversely impacts fishers	
Mediterranean and Sierra Nevada conifer forests	Carbon storage	Reduced from removal of woody biomass	Powers et al. 2013, Serrano-Ortiz et al. 2013
Pacific Northwest USA	Burn severity	Increased between successive fire events in logged areas	Thompson et al. 2007
Northeastern Alberta, Canada	Byrophytes	Negative effect on species richness and species composition	Bradbury 2006
Northwest Quebec, Canada	Soil nutrients	Loss of Calcium, Magnesium, and Potassium for at least 110-year timber rotation	Brais et al. 2000

Finally, a recent meta-analysis of postfire logging in western forests by Bognounou et al. (2020) documented widespread impacts to bird assemblages as noted:

**Abstract:** Increased demand for timber, the reduction in the available timber resources, more frequent and severe forest fires under a changing climate have increased the use of salvage logging in North American forests despite concerns regarding impacts on biodiversity and long-term forest productivity. We aimed to complement previous approaches that used bird species richness or individual abundance in salvage-logged habitats to assess the sustainability of this practice. We looked for commonalities in the taxonomic, functional and phylogenetic components of bird assemblages among these three post-disturbance habitats across a broad geographic range. We compiled six North American datasets selected from primary and grey literature that documented species composition of avian assemblages in habitats after recent fire, post-fire salvage logging and traditional logging. Our results revealed contrasting patterns of bird trait assemblage among burned, post-fire salvage and traditionally logged habitats. In salvage-logged habitats, taxonomic diversity, functional diversity, functional and phylogenetic redundancy were significantly lower than in both burned and traditionally logged habitats. The frequency of insectivores was significantly lower after salvage logging than after both fire and traditional logging. These findings suggest that cumulative disturbances have a negative effect on early assembly of bird communities. The outcomes of this study encourage further

assessments, at landscape level, of salvage logging intensity, burn size and fire severity on bird functional structure to better plan for their conservation.

In closing, my declaration completely refutes ODFs claims that modified clearcuts followed by replanting are needed to achieve desired future conditions of old forest as the materials I presented including peer reviewed papers, illustrations, and summaries show compelling evidence to the contrary. ODF's claims are not supported by best available science. ODF cannot see the complex forest for the biological legacies. The agencies' assumptions and retention standards are woefully inadequate.

Comments	Your proposed approach to post fire logging of the Fern Ridge area of the Santiam State Forest is an unconscionable land grab on behalf of the for-profit, corporate timber industry and an attempt to use the recent fires as a flimsy excuse to do further damage to a invaluable public and natural resource. Forests recover from fire best when allowed to recover naturally. Any logging beyond the bare minimum necessary to preserve public safety would be a farce. To cut 239 out of a potential 270 acres is would be a travesty. Please reconsider.

Is there some way to obtain a permit or other legal document that would allow one to enter the santiam state forest in areas that are currently closed? While I understand the hazards that were brought by the recent forest fires, I do not understand why there is not a way for people to gain foot access to the forest. These hazards are more impactful towards vehicle use on roads in the forest and not towards hikers. As state forests are public land I do not believe that foot travel should ever be limited and this current situation is very disappointing. However, I care less about vehicle use and more about hiking so I would like to be informed of a way to legally enter the state forest on foot.

Subject	Annual Operations Plans for Fiscal Year 2022
Comments	<p>The 2022 AOP proposes to harvest 399 acres from a 16,600 acre burned area. Proposed harvest of 6.5 mmbf from a range of 8 to 25 mmbf.. What a bunch of overachievers! Proposal to treat 2% of the acreage burned. The result will be years of methane released into the atmosphere.. Where is the department consideration of the governors climate reduction directives? I guess its forgotten the DOF was found to have failed to harvest for decades and a Linn County jury ruled the DOF failed to live up to its contractual obligations to the counties and a judge ordered the State to pay the counties \$1 billion. If you aren't going to manage the lands then return them to the counties to manage.</p>

**Fern Ridge Forest Management Project  
Post-Fire 2020 Santiam State Forest**

ODF Staff:

The Great Old Broads for Wilderness is a non-profit organization dedicated to the protection of our public forests and wild places. This letter is a comment on the Fern Ridge Pre-Operations Report for management of the impacts of the 2020 wildfire that burned much of the Fern Ridge portion of the Santiam State Forest. These comments are submitted on behalf of the Cascade-Volcano chapter, based in NW Oregon (Portland). There are chapters of Great Old Broads throughout Oregon, and our members frequently recreate and otherwise use and rely on areas of the Santiam State Forest covered by this Pre-Operations Report (POR).

It is our understanding that the entire Fern Ridge area of the Santiam is proposed for inclusion in the Habitat Conservation Plan under environmental review, and is proposed as Habitat Conservation Areas (HCA) and Riparian Conservation Areas (RCA). Our comments are influenced greatly by our evaluation of potential impacts of the proposed post-fire logging in Fern Ridge to HCAs and RCAs. We appreciate many aspects of the plan, but have significant concerns about the roadside hazard tree removal plan, to be addressed later in these comments.

We appreciate the post-fire management plan that will be monitored for development of late seral forest characteristics under four different treatments:

- 1) No management
- 2) Underplanting only
- 3) Hazard mitigation partial cuts
- 4) 14-acre modified clear-cut

This should provide very helpful information for post-fire management in the future.

The undersigned attended the Public informational session of the Fern Ridge Forest Management Project on 10/27/2021, and also has reviewed the POR posted on the DOF website. We find discrepancies. I asked the overall size of the Fern Ridge area, and was told approximately 60-80 acres. The POR presents 270 acres covered by the plan. That is a big difference. I thought that in response to a question I posed, that the hazard tree removal area was about 13 acres—although I could be mistaken. It is in fact **net ~200 acres**, according to the POR. Also a huge discrepancy. As currently proposed only 66 acres will not be subject to some level of harvest. The description of the project at the Informational Session sounded conservative, in recognition of the proposed HCA status. However, the POR states, in Table 1, that 1000 MBF may be harvested from Unit 2, the roadside hazard tree removal areas. That is

almost 2/3 of the timber output for entire Fern Ridge project, and almost twice the volume anticipated from the 14-acre modified clear-cut.

For **Unit 1, the modified clear-cut** described retention of all live trees (at least 15% green crown), both conifers and hardwoods. A mosaic of green trees and snags would be retained, an average of 11/acre. We applaud this conservative approach, that will benefit the recovery of the future condition of Layered Forest Structure. There is a proviso that retention of live trees may be less due to safety hazard or operational feasibility. We urge that any such stands be re-evaluated and leave snags that cannot be accessed safely because of live trees, rather than removing live trees.

**Unit 2, Partial Cut Hazard Mitigation**, is described in the POR as cutting hazard trees and snags within 1½ tree lengths of the road. We urge the DOF to revise the criteria, and suggest criteria proposed by the Willamette National Forest for roadside danger trees<sup>1</sup>. They proposed cutting hazard trees *within one tree-height of the road*. We recognize that this is well-loved recreation area and public safety is a priority.

“Danger trees which may strike the road would be felled where they are found and trees which do not threaten the roads would be left standing.”

Thus, the Fern Ridge area, where roadside areas slope away from the road, we request that the trees be left standing. Burned trees within one tree-height of the road should be evaluated for removal due to hazard.

“Additional trees within 1.5 tree-heights from the road may be felled in areas of high use or where people stop, such as intersections, dispersed camping areas, viewpoints, parking areas, and pull-outs.”

Thus in the Fern Ridge area, we would request that the 1.5 tree-height criteria be applied to restroom areas, picnic areas, trailheads, and parking areas, to ensure public safety.

Reviewing the maps overlaid on aerial photographs post-fire, it appears from Map 1 that much of the northern roadsides have green trees throughout, and do not need hazard tree removal. We request that these road segments be re-evaluated, and any road segments without fire damage be removed from Unit 2.

Map 2 with the aerial photo overlay shows an area south of Units 3 and 4 that appears to be severely burned around a possible switchback. With the demarcated 1 ½ tree-lengths for hazard tree removal, the entire area looks like it could be logged, and at least the size of Unit 1 that will be clear-cut at 14 acres. The impact will be much reduced if DOF adjusts the criteria to 1 tree-length except in areas of high human use.

**Unit 3, Underplanting area.** We recommend that diverse seeds and seedlings be used for underplanting in Unit 3, and are for replanting of Unit 1, recognizing the goal of future Layered Structure, and that as HCA and RCA, these areas will not be harvested in the future, but managed for habitat. We also request that the HCA and RCA be managed for carbon sequestration and storage, in accord with the Climate Change and Carbon Plan recently approved by the Board of Forestry.

**Aquatic Resources.** The POR describes a plan to remove a stream crossing on a legacy road on Shellburg Creek. We applaud that action. Although we do have a question, does “legacy road” mean it is “left over” from previous timber operations and no longer needed? Could this legacy road be evaluated for abandonment? That might be a question more appropriately addressed after the HCP is approved.

<sup>1</sup> Willamette 2020 Fires Roadside Danger Tree Reduction Project Scoping Notification.

However, if this road segment is a candidate for abandonment, we request that the creek crossing be removed, but the legacy road not be subject to hazard tree removal, even if that means the road is closed for safety.

At the Informational Session, the Aquatic Riparian Specialist Sarah Dyrdaahl (sp?) described that larger creek buffers of 120' will be established. Any danger trees within the buffer will be subject to "Fall and leave", and felled in the creek wherever possible. No salvage or harvest will occur within the riparian areas. The riparian zones will be monitored for natural regeneration and soil health. Some active restoration in the form of underplanting may occur. We applaud this approach. In our comments of the initial Operational Plan for Santiam State Forest submitted April 6, 2021, we urged following guidelines for the future Habitat Conservation Plan, such as for wider creek buffers. So are very pleased to hear about this plan for aquatic resource protection. We request that the information of buffer size be included in the Pre-Operational Report in the Aquatic Resources section, which it is not as currently written. Included is the important statement "Hazard trees within RMAs will be felled toward the stream, where possible, and left within the RMA." (Riparian Management Area)

**Rational for our recommendations.** As the Fern Ridge area has been designated for the future condition of Layered forest structure, post-fire logging sets back the trajectory to that structure. Thus very conservative harvest criteria consistent with public safety is warranted. Especially as the area is proposed under the HCP as Habitat Conservation Area and Riparian Conservation Area. Timber harvest, while removing trees, disturbs the soil, already fragile from the burn, and damages some of the naturally regenerating trees and understory species. Thus impairing the natural regeneration of complex forest structure. This early seral habitat is rich in wildlife species that specialize in or prefer burned forest habitat, with many cavities and often an abundance of fruits and seed in the flush of understory growth, which also attract prey species for predatory birds. In addition, forest carbon is retained at 85-90% in standing burned trees, downed wood and soil; post-fire harvest has a much greater impact on reduction of forest carbon.

**Summary.** Great Old Broads appreciate the efforts of the DOF to retain unharvested areas of burned forest, in unmanaged and understory planted areas, for monitoring comparisons with the modified clear-cut and partial harvest areas along roadways. Wider riparian buffers with any hazard trees felled and left is excellent. We strongly urge revisions of the criteria for roadside hazard tree removal, as described above. We request that the Pre-Operations Report be revised with appropriate public comments and made available to the public on the DOF website, with notification to those who attended the Informational Session and/or submit public comments.

Sincerely,

Darlene Chirman

# Fern Ridge Forest Management Project Greatest Permanent Value Survey

2020's Labor Day fires burned with high severity over much of the Shellburg Falls Recreation Area. The Oregon Department of Forestry is creating a recovery plan for the area known as the Fern Ridge forest project. It takes into account ODF's legal mandate to produce social, economic, and environmental benefits to all Oregonians. This includes repairing and upgrading trails and infrastructure, preserving sensitive riparian areas, removing hazardous trees along roadways, and a proposed 14-acre post-fire timber sale.

This survey is being conducted as part of a 30-day public comment period on Phase 2 of the Fiscal Year 2022 North Cascade Annual Operations Plan. The comment period opens Monday, November 1 and closes Tuesday, November 30. Your answers will be published with a summary of comments on the ODF website, and will be considered by planners before the final plan is approved.

Email \*

What's your name? \*

khy j griffin

## Trade-offs are inherent in balanced forest management.

ODF's obligation to produce social, economic & environmental benefits is established in Oregon Administrative Rule and is commonly known as the Greatest Permanent Value rule. To achieve this aim, ODF must consider numerous practical factors that often involve trade-offs. This survey is designed to get your input as to how the Fern Ridge project meets the social, economic and environmental benefits required of state forestlands. You'll also have an opportunity to let us know how ODF staff can improve upon the project plan.

How satisfied are you that the Fern Ridge forest project provides social benefits to Oregonians, including safe public recreation and potential education/interpretation opportunities? \*

1                      2                      3                      4                      5

Very satisfied                                    Very dissatisfied

Specific to the Fern Ridge forest project, how could ODF improve its approach to generating social benefits for Oregonians?

.....

How satisfied are you that the Fern Ridge forest project provides economic benefits to Oregonians, including revenue to county partners and local taxing districts? \*

## **RE: Phase 2 North Cascade Annual Operations Plan**

Dear District Forester Steve Wilson:

Thank you for the opportunity to provide comments on the second phase of the Oregon Department of Forestry (ODF) North Cascade District Annual Operations Plan (AOP) for Fiscal Year 2022.

It's disappointing that ODF decided to divert from the original plan for the Fern Ridge salvage sale. At the June 11, 2021, State Forest Advisory Committee meeting, ODF released a harvest layout for the sale that was quite larger than what is being proposed now. This area experienced moderate to high severity burns in merchantable stands that could produce revenue for ODF and Marion County. This is especially frustrating knowing that future sales will be limited or reduced, especially in Marion and Clackamas Counties where a majority of the Beachie Creek fire burned.

In the spirit of demonstrating Greatest Permanent Value, ODF could do so by removing more dead wood to generate revenue, accelerate restoration, and reduce safety concerns in a heavily trafficked recreational area. Instead, ODF is leaving merchantable volume in Units 3 and 4 where a majority of those trees are dead or dying. More focus should be placed on the economics of this salvage effort to better support recovery and restoration efforts. Adding the volume from these units would make this sale more attractive to purchasers and still allow educational opportunities for the public.

There are other areas that could be used to demonstrate different management types. ODF could turn Unit 6 from June 2021 map into the "no management" stand, instead of Unit 4. Unit 6 is near Shellburg Falls, so more visitors will see the interpretive signs ODF plans to install. ODF could even construct trails through the middle of the stand so visitors could get the full experience. Not to mention, there are already plenty of examples of no management post-fire across the Cascades. Leaving stands unmanaged increases the chances of reburn. A recent example of this was the Bull Complex fire north of Detroit where there were multiple fire scars that reburned this summer. If these stands within the Fern Ridge Sale were to burn again, what benefits would they continue to provide?

The Pre-Operations Report says the modified clear-cut prescription "allows ODF to quickly re-introduce native species... and guarantees growing space for the next cohort of trees..." If this is

true, why not apply the same prescription to Units 3 and 4? The report goes on to say “Due to the amount of overstory mortality in Unit 3, we are augmenting the residual stand with new cohort of planted conifer to achieve a layered DFC condition more quickly.” Again, wouldn’t harvesting the dead trees help speed up the process even more? It also states “Although no management areas may take longer to achieve the DFC of Layered when compared to actively managed areas, they will provide interim benefits at the landscape level.” Do those interim benefits really outweigh long term management strategies and overall forest health?

As we have stated multiple times, there is no reason – practical or legal – for ODF to be implementing elements of a draft Habitat Conservation Plan that has yet to be fully analyzed or approved. It is also frustrating that ODF has chosen to wait this long to offer a salvage sale. Trees are deteriorating quickly, as we are over a year out from the 2020 Labor Day fires.

### **Fern Ridge Sale Suggestions and Comments:**

- ODF should add Unit 1 from June 2021 map back into this sale. The stand is severely burnt but still merchantable. It’s a small unit and far enough away from Shellburg Falls and the campsites that it should not be considered controversial to harvest.
- This sale should at the least include partial harvest of dead trees in Unit 3, followed by underplanting as planned. This will accelerate reforestation, clear hazard trees, and add volume to sale.
- There are several pockets of dead trees north of the campgrounds but outside of the roadside unit. ODF should include these in the partial cut/hazard tree removal to add volume and reduce safety concerns.
- The report says that “approximately 154 green trees and snags will be left... (approximately 11 per acre).” This is really high compared to previous salvage or typical green sales and should be reduced.
- Is ODF confident the roadside harvest will produce 1,000 MBF? Many of the roads included in this unit were barely affected by the fire. Hampton Lumber has purchased other ODF salvage sales where the roadside harvest was only around 15 percent of what was advertised.
- Contractors need flexibility when removing hazard trees. We appreciate the inclusion that “specific guidelines of what constitutes a hazard tree will be outlined in the timber sale contract.” This has worked well in the field with district staff and contractors on other salvage sales.
- Harvest timing flexibility is critical during salvage efforts, especially when the salvage sales are sold over one year after the fires have occurred. It will be important for this sale to provide wet weather availability. We strongly encourage the ODF to maintain wet weather access as noted in Table 4 of the Pre-Operations Report.

We recognize the difficulties ODF has faced as a result of the 2020 Labor Day fires and appreciate the “all hands on deck” approach that was taken to begin restoration of the Santiam State Forest. That said, we believe this sale could be improved and hope you will consider our comments and suggestions.

Sincerely,

A handwritten signature in black ink, appearing to read "Laura Wilkeson", with a long horizontal flourish extending to the right.

# Fern Ridge Forest Management Project Greatest Permanent Value Survey

2020's Labor Day fires burned with high severity over much of the Shellburg Falls Recreation Area. The Oregon Department of Forestry is creating a recovery plan for the area known as the Fern Ridge forest project. It takes into account ODF's legal mandate to produce social, economic, and environmental benefits to all Oregonians. This includes repairing and upgrading trails and infrastructure, preserving sensitive riparian areas, removing hazardous trees along roadways, and a proposed 14-acre post-fire timber sale.

This survey is being conducted as part of a 30-day public comment period on Phase 2 of the Fiscal Year 2022 North Cascade Annual Operations Plan. The comment period opens Monday, November 1 and closes Tuesday, November 30. Your answers will be published with a summary of comments on the ODF website, and will be considered by planners before the final plan is approved.

## **Trade-offs are inherent in balanced forest management.**

ODF's obligation to produce social, economic & environmental benefits is established in Oregon Administrative Rule and is commonly known as the Greatest Permanent Value rule. To achieve this aim, ODF must consider numerous practical factors that often involve trade-offs. This survey is designed to get your input as to how the Fern Ridge project meets the social, economic and environmental benefits required of state forestlands. You'll also have an opportunity to let us know how ODF staff can improve upon the project plan.

How satisfied are you that the Fern Ridge forest project provides social benefits to Oregonians, including safe public recreation and potential education/interpretation opportunities? \*

1                      2                      3                      4                      5

Very satisfied                                    Very dissatisfied

Specific to the Fern Ridge forest project, how could ODF improve its approach to generating social benefits for Oregonians?

Open the entire Shellburg trail system as soon as possible with interpretive signage discussing post-fire recovery projects and historical use of the area. Will the campground re-open? Partner with OPRD for the trail connection to Silver Falls.

---

How satisfied are you that the Fern Ridge forest project provides economic benefits to Oregonians, including revenue to county partners and local taxing districts? \*

1                      2                      3                      4                      5

Very satisfied                                    Very dissatisfied

Specific to the Fern Ridge forest project, how could ODF improve its approach to generating economic benefits for Oregonians?

It looks like many board feet will be generated from this project.

---

How satisfied are you that the Fern Ridge forest project provides environmental benefits to Oregonians in the context of a post-fire landscape? \*

1                      2                      3                      4                      5

Very satisfied                                    Very dissatisfied

Specific to the Fern Ridge forest project, how could ODF improve its approach to generating environmental benefits for Oregonians?

Post-fire projects are crucial to restore the canopy, protect the watershed and riparian areas, and restore wildlife habitat. We need to provide shade to reduce temperatures, mitigate erosion and runoff into streams, and capture carbon.

Do you have any other input you would like ODF to consider?

Use this area as a model for fire recovery. Create interpretive signage to explain past, present and future goals and uses of this area. Provide safe public access as soon as possible and promote ways for local residents to get involved in the restoration.

Would you like to receive email updates about ODF's state forest management activities? \*

**RE: Phase 2 North Cascade Annual Operations Plan**

Dear District Forester Steve Wilson,

Thank you for the opportunity to provide comments on Phase 2 of the North Cascade Annual Operations Plan (AOP). The Oregon Forest & Industries Council (OFIC) is a statewide trade association representing forestland owners and forest products manufacturers. Its members own more than 90 percent of Oregon's large, privately owned forestland. OFIC's core mission is to advocate on behalf of its members to maintain a positive, stable business operating environment for Oregon's forest products sector that fosters long-term investments in healthy forests; to ensure a reliable timber supply from Oregon's public and private forestlands; and to promote stewardship and sustainable management of forestlands that protect environmental values and maintain productive uses on all forestlands.

OFIC supports active restoration and recovery from the devastating effects of the 2020 Labor Day fires. Active management is vitally important to help stabilize soils and stream banks, promote clean water, foster carbon sequestration, restore fish and wildlife habitat, return forests to a healthy trajectory, and minimize the potential for reburn in these areas with so much mortality. The timely harvest of standing dead trees followed by reforestation maximizes the value of forest resources.

OFIC supports using this harvest as a demonstration of the value of managing forests but believes the management could be improved by prioritizing more acres and more trees for harvest, thus maximizing the opportunity to demonstrate the long-term value of forest management. OFIC is concerned with the Department's plan to only harvest and reforest on a fraction of the State Lands impacted by these fires. ODF should manage our public forests in a way that will accelerate recovery and minimize risk of reburn. Furthermore, OFIC believes that the State should include a stop on this trail or demonstration area that speaks about the forest products created through the recovery efforts across landownerships.

In the Pacific Northwest there are several examples of similar restoration efforts from previous generations that benefit society today. When Mount St Helens erupted it left a devastated forest in its wake. Two management paradigms emerged; natural recovery and accelerated recovery through management. Forty years later the contrast could not be more stark; green forests on private and State ownership comes to an abrupt end at the border with National Volcanic Monument Land.

The Tillamook burn is another example of the value of forest management following catastrophic fire. Seventy years later all Oregonians benefit from that hard work and dedication of those early restoration pioneers.

Both familiar examples offer tangible evidence of the long-lasting and real value that comes from sound stewardship through focused harvest and reforestation recovery efforts. Oregonians expect the State to follow in the footsteps of these pioneers to effectively recover these vital forest resources. OFIC urges the State to increase the acres and volume projected for harvest in Phase 2 to set more of our state forests on a trajectory towards effective and efficient recovery. This vital recovery effort will leave a legacy of stewardship for generations to come.

Thank you for the opportunity to provide comments.

Sincerely,

To: ODF, Santiam State Forest Re: 2nd Phase North Cascade District Annual Operations Plan

The Oregon Chapter Sierra Club has serious concerns about the 2<sup>nd</sup> Phase North Cascade District's Annual Operations Plan on the Santiam State Forest. As it was outlined, ODF is proposing to divide the area into four treatment areas: no management, underplanting only, hazard mitigation with partial cuts, and 14 acres of modified clear-cut.

We don't need a demonstration project in the Santiam Forest to see if logging after fire slows development into mature forest. Science has clearly demonstrated that in the wake of wildfires, the best approach to ecological recovery is to do nothing and let nature take its course. Post-fire logging impedes the natural process of forest rejuvenation by degrading wildlife habitat, harming forested watersheds, and removing important habitat for insect and bird species that return soon after even the highest severity fires. Ecologically healthy forests have an abundance of dead and downed logs, which are crucial for storing water in fire-affected landscapes.

The Fern Ridge Wildlife Area has been designated in the draft Western Oregon State Forest HCP as a habitat conservation area and riparian conservation area. Post-fire logging and road building destroys snag forest wildlife habitat, disturbs fragile soils and damages plant regrowth. Conducting a modified clear-cut in areas that are slated for long-term protection for wildlife habitat is counterproductive. It ignores the ecological importance of snag forest habitat and may destroy the very habitat the HCP plans to protect.

Judicious cutting of hazardous trees may be warranted, but post-fire logging typically removes most of the remaining trees (live and dead). This Operations Plan must avoid the type of hazardous tree removal we saw along Hwy 22 and on the road into Breitenbush, where top scientists and hired certified arborists agreed that trees were marked indiscriminately, without proper application of normal assessment criteria.

Forests of the Pacific Northwest have an enormous potential to mitigate the climate crisis through their ability to sequester carbon and keep it safely stored for centuries—but only if we protect our forests from clearcutting, aggressive thinning, and post-fire logging.

Thank you for your consideration of these comments.

Subject: Annual Operations Plans for Fiscal Year 2022

Sorry if this was mentioned & I missed it but I feel there shouldn't be any hurry to let the public recreate in these areas. Too many people have been treating our public areas with too much disrespect in recent years. These places should get the time needed to grow & let nature be without people around for awhile. The wildlife deserve that much at least. Seems mostly selfish people want access to areas no longer even worth a visit. I say keep the public OUT for a few years. The Columbia Gorge Eagle creek I think was rushed. Landslides & safety are still an issue. Really let nature do it's thing outside of what we do to those areas. I personally do not want to hike in a burned up forest. I hiked because of the forest & greenery. Selfish people can go elsewhere

Dear Oregon.Gov,

I support the Oregon Department of Forestry's plan to replant and restore the Shellburg Falls Recreation Area by removing burned trees and repairing trails and roads.

In fact, the Department should do everything it can to bring back not just Shellburg Falls, but all areas within the Santiam State Forest that were devastated by 2020's Beachie Creek Fire.

I trust professional foresters to do whatever they need to do to bring back the Santiam State Forest for future generations to enjoy.

Thank you.

Dear Oregon.Gov,

I'm writing in support of the plan to remove dangerous and/or dead trees and to restore the Shellburg Falls Recreation Area. I urge the Department of Forestry to do everything it can to bring back the Santiam State Forest for future generations of Oregonians. Don't delay.

No action will only increase future fire risk and remove these lands from recreation and/or productive use for decades. Please don't let that happen.

Move forward with the Shellburg Falls restoration plan and act quickly to restore other areas of the Santiam State Forest ravaged by fire.

Thank you.

Replant and Restore the Santiam State Forest  
Public Lands and Natural Resources

Dear Oregon.Gov,

I'm writing in support of the plan to remove dangerous and/or dead trees and to restore the Shellburg Falls Recreation Area. I urge the Department of Forestry to do everything it can to bring back the Santiam State Forest for future generations of Oregonians. Don't delay.

No action will only increase future fire risk and remove these lands from recreation and/or productive use for decades. Please don't let that happen.

Move forward with the Shellburg Falls restoration plan and act quickly to restore other areas of the Santiam State Forest ravaged by fire.

Thank you.

Sincerely,  
Lynn Mcdonald

Replant and Restore the Santiam State Forest  
Public Lands and Natural Resources

Dear Oregon.Gov,

I support the Oregon Department of Forestry's plan to replant and restore the Shellburg Falls Recreation Area by removing burned trees and repairing trails and roads.

In fact, the Department should do everything it can to bring back not just Shellburg Falls, but all areas within the Santiam State Forest that were devastated by 2020's Beachie Creek Fire.

I trust professional foresters to do whatever they need to do to bring back the Santiam State Forest for future generations to enjoy.

Thank you.

Replant and Restore the Santiam State Forest  
Public Lands and Natural Resources

Dear Oregon.Gov,

I'm writing in support of the plan to remove dangerous and/or dead trees and to restore the Shellburg Falls Recreation Area. I urge the Department of Forestry to do everything it can to bring back the Santiam State Forest for future generations of Oregonians. Don't delay.

No action will only increase future fire risk and remove these lands from recreation and/or productive use for decades. Please don't let that happen.

Move forward with the Shellburg Falls restoration plan and act quickly to restore other areas of the Santiam State Forest ravaged by fire.

Thank you.

Sincerely,  
William J Wiggins

Replant and Restore the Santiam State Forest  
Public Lands and Natural Resources

Dear Oregon.Gov,

I'm writing in support of the plan to remove dangerous and/or dead trees and to restore the Shellburg Falls Recreation Area. I urge the Department of Forestry to do everything it can to bring back the Santiam State Forest for future generations of Oregonians. Don't delay.

No action will only increase future fire risk and remove these lands from recreation and/or productive use for decades. Please don't let that happen.

Move forward with the Shellburg Falls restoration plan and act quickly to restore other areas of the Santiam State Forest ravaged by fire.

Thank you.

Sincerely,  
Ted Meier

Public Lands and Natural Resources

Dear Oregon.Gov,

I support the Oregon Department of Forestry's plan to replant and restore the Shellburg Falls Recreation Area by removing burned trees and repairing trails and roads.

In fact, the Department should do everything it can to bring back not just Shellburg Falls, but all areas within the Santiam State Forest that were devastated by 2020's Beachie Creek Fire.

I trust professional foresters to do whatever they need to do to bring back the Santiam State Forest for future generations to enjoy.

Thank you.

Replant and Restore the Santiam State Forest  
Public Lands and Natural Resources

Dear Oregon.Gov,

I support the Oregon Department of Forestry's plan to replant and restore the Shellburg Falls Recreation Area by removing burned trees and repairing trails and roads.

In fact, the Department should do everything it can to bring back not just Shellburg Falls, but all areas within the Santiam State Forest that were devastated by 2020's Beachie Creek Fire.

I trust professional foresters to do whatever they need to do to bring back the Santiam State Forest for future generations to enjoy.

Thank you.

Replant and Restore the Santiam State Forest  
Public Lands and Natural Resources

Dear Oregon.Gov,

Oregonians treasure the Shellburg Falls Recreation Area. I'm writing today to add my voice to others in support of restoration of the Santiam State Forest in the wake of the Beachie Creek Fire.

Please move quickly to remove dead trees, remedy fire-caused erosion and restore trails and roads. I support letting professional foresters do their work.

It's clear that failure to take action will only increase future fire risk and remove these lands from recreation and/or productive use for decades. Please don't let that happen.

Let's do everything we can to bring back the Santiam State Forest for future generations of Oregonians.

Move forward with the Shellburg Falls restoration plan and act quickly to restore other areas of the Santiam State Forest ravaged by fire.

Replant and Restore the Santiam State Forest  
Public Lands and Natural Resources

Dear Oregon.Gov,

I'm writing in support of the plan to remove dangerous and/or dead trees and to restore the Shellburg Falls Recreation Area. I urge the Department of Forestry to do everything it can to bring back the Santiam State Forest for future generations of Oregonians. Don't delay.

No action will only increase future fire risk and remove these lands from recreation and/or productive use for decades. Please don't let that happen.

Move forward with the Shellburg Falls restoration plan and act quickly to restore other areas of the Santiam State Forest ravaged by fire.

Thank you.

Sincerely,  
Ellie Carson

Replant and Restore the Santiam State Forest  
Public Lands and Natural Resources

Dear Oregon.Gov,

I support the Oregon Department of Forestry's plan to replant and restore the Shellburg Falls Recreation Area by removing burned trees and repairing trails and roads.

In fact, the Department should do everything it can to bring back not just Shellburg Falls, but all areas within the Santiam State Forest that were devastated by 2020's Beachie Creek Fire.

I trust professional foresters to do whatever they need to do to bring back the Santiam State Forest for future generations to enjoy.

Thank you.

As a professional arborist / forester and having worked in forestry over 40 years and as a consulting forester over 25 years, the time for forest management is now. We must act now to reduce the tree hazards, and harvest what is salvageable before insects make it wood bad. Insects attacking Douglas firs will spread to healthy trees and make the situation worse. Action must be taken for proper forest management, not the political correctness management which makes the forests unhealthy. Please cut the red tape and get the forest restoration started as quick as possible.

Thank you.

Public Lands and Natural Resources

Dear Oregon.Gov,

I'm writing in support of the plan to remove dangerous and/or dead trees and to restore the Shellburg Falls Recreation Area. I urge the Department of Forestry to do everything it can to bring back the Santiam State Forest for future generations of Oregonians. Don't delay.

No action will only increase future fire risk and remove these lands from recreation and/or productive use for decades. Please don't let that happen.

Move forward with the Shellburg Falls restoration plan and act quickly to restore other areas of the Santiam State Forest ravaged by fire.

Thank you.

Sincerely,  
Jerry Lackner

Replant and Restore the Santiam State Forest  
Public Lands and Natural Resources

Dear Oregon.Gov,

Get the job done! Restore and replant the Santiam State Forest, starting with Shellburg Falls.

I support the Oregon Department of Forestry's plan to replant and restore the Shellburg Falls Recreation Area by removing burned trees and repairing trails and roads.

In fact, the Department should do everything it can to bring back not just Shellburg Falls, but all areas within the Santiam State Forest that were devastated by 2020's Beachie Creek Fire.

I trust professional foresters to do whatever they need to do to bring back the Santiam State Forest for future generations to enjoy.

Thank you.

Dear Oregon.Gov,

I'm writing in support of the plan to remove dangerous and/or dead trees and to restore the Shellburg Falls Recreation Area. I urge the Department of Forestry to do everything it can to bring back the Santiam State Forest for future generations of Oregonians. Don't delay.

No action will only increase future fire risk and remove these lands from recreation and/or productive use for decades. Please don't let that happen.

Move forward with the Shellburg Falls restoration plan and act quickly to restore other areas of the Santiam State Forest ravaged by fire.

Thank you.

Sincerely,

Replant and Restore the Santiam State Forest  
Public Lands and Natural Resources

Dear Oregon.Gov,

I am a Naturopathic Doctor and a hiker. Scientific studies reports that being in forests and by water (waterfalls, streams, lakes, the ocean) reduces stress and improves health. I read a medical report a few years ago about how some Doctors were writing prescriptions for weekly walks in the forest for both the exercise and Nature-bathing effects and there are studies that revealed that trees emanate phytochemicals that improve both physical and mental health. I have personally experienced an improved sense of well-being and relaxation whenever I spend time in the forest and by water. Nature rejuvenates me.

I am writing to encourage you to carry out the plan to remove dangerous and/or dead trees and to restore the Shellburg Falls Recreation Area so that Oregonians and visitors to Oregon can spend time there.

I urge the Department of Forestry to do everything it can to bring back the Santiam State Forest for future generations of Oregonians.

No action will only increase future fire risk and remove these lands from recreation and/or productive use for decades.

Move forward with the Shellburg Falls restoration plan and act quickly to restore other areas of the Santiam State Forest ravaged by fire.

Thank you.

Public Lands and Natural Resources

Dear Oregon.Gov,

I'm writing in support of the plan to remove dangerous and/or dead trees and to restore the Shellburg Falls Recreation Area. I urge the Department of Forestry to do everything it can to bring back the Santiam State Forest for future generations of Oregonians. Don't delay.

No action will only increase future fire risk and remove these lands from recreation and/or productive use for decades. Please don't let that happen.

Move forward with the Shellburg Falls restoration plan and act quickly to restore other areas of the Santiam State Forest ravaged by fire.

Thank you.

Sincerely,  
Flynn Case

Replant and Restore the Santiam State Forest  
Public Lands and Natural Resources

Dear Oregon.Gov,

I support the Oregon Department of Forestry's plan to replant and restore the Shellburg Falls Recreation Area by removing burned trees and repairing trails and roads.

In fact, the Department should do everything it can to bring back not just Shellburg Falls, but all areas within the Santiam State Forest that were devastated by 2020's Beachie Creek Fire.

I trust professional foresters to do whatever they need to do to bring back the Santiam State Forest for future generations to enjoy.

Thank you.

Dear Oregon.Gov,

I'm writing in support of the plan to remove dangerous and/or dead trees and to restore the Shellburg Falls Recreation Area. I urge the Department of Forestry to do everything it can to bring back the Santiam State Forest for future generations of Oregonians. Don't delay.

No action will only increase future fire risk and remove these lands from recreation and/or productive use for decades. Please don't let that happen.

Move forward with the Shellburg Falls restoration plan and act quickly to restore other areas of the Santiam State Forest ravaged by fire.

Thank you.

Sincerely,  
Fred Williams

Public Lands and Natural Resources

Dear Oregon.Gov,

I support the Oregon Department of Forestry's plan to replant and restore the Shellburg Falls Recreation Area by removing burned trees and repairing trails and roads.

In fact, the Department should do everything it can to bring back not just Shellburg Falls, but all areas within the Santiam State Forest that were devastated by 2020's Beachie Creek Fire.

I trust professional foresters to do whatever they need to do to bring back the Santiam State Forest for future generations to enjoy.

Thank you.

Sincerely,  
Daniel Radke
